

Wall Industries, Inc.

LANC1212DW12

DC/DC Converter 9-18 VDC Input ±12 VDC Output at ±0.5A

Applications:

- Distributed Power Architectures
- Communications Equipment
- Computer Equipment
- Work Stations

Features:

- RoHS Compliant
- Dual Output
- Standard 24 Pin DIP and SMT Package
- Five-Sided Continuous Shield
- No Minimum Load Required
- High Power Density
- High Efficiency up to 88%
- Small Size: 1.25 x 0.8 x 0.450 Inches
- Input to Output Isolation (1600VDC)
- 2:1 Wide Input Voltage Range
- Fixed Switching Frequency
- Input Under-Voltage Protection
- Output Over-Voltage Protection
- Over-Current Protection
- Output Short Circuit Protection
- Remote ON/OFF

Description:

The LANCW12 dual output series offers 12 watts of output power from a package in an IC compatible 24 pin DIP and SMT configuration. LANCW12 dual output series has 2:1 wide input voltage of 9-18VDC, 18-36VDC, and 36-75VDC. The LANCW12 dual output series features 1600VDC of isolation, short circuit protection and five sided shielding. All models are particularly suited for telecommunications, industrial, mobile telecom, and test equipment applications.

All specifications are based on 25 °C. Nominal Input Voltage and Maximum Output Current unless voltaviants. New	chnical Specifications	Model No. LANC1212

DESIGN CONSIDERATIONS:

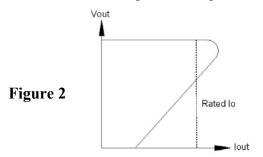

Output Over Current Protection

When excessive output currents occur in the system, circuit protection is required on all power supplies. Normally, overload current is maintained at approximately 150% of rated current for the LANCW12 dual output series.

Fold back-mode is a method of operation in a power supply whose purpose is to protect the power supply from being damaged during an over-current fault condition. It also enables the power supply to operate normally when the fault is removed.

One of the problems resulting from over current is that excessive heat may be generated in power devices; especially MOSFET and Schottky diodes and the temperature of those devices may exceed their specified limits. A protection mechanism has to be used to prevent those power devices from being damaged.

The operation of fold back is as follows. When the current sense circuit sees an over-current event, the output voltage of the module will be decreased for low power dissipation and decrease the heat of the module.

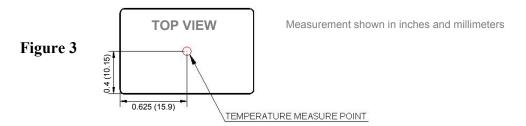

Input Source Impedance

The power module should be connected to a low impedance input source. Highly inductive source impedance can affect the stability of the power module. Input external L-C filter is recommended to minimize input reflected ripple current. The inductor is simulated source impedance of 12μ H and capacitor is Nippon chemi-con KZE series 47μ F/100V. The capacitor must as close as possible to the input terminals of the power module for lower impedance.

Thermal Consideration

The power module operates in a variety of thermal environments. However, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convention, and radiation to the surrounding environment. Proper cooling can be verified by measuring the point as the figure below. The temperature at this location should not exceed 105°C. When operating, adequate cooling must be provided to maintain the test point temperature at or below 105°C. Although the maximum point temperature of the power modules is 105°C, you can limit this temperature to a lower value for extremely high reliability.

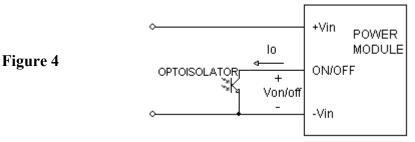

Remote ON/OFF Control

The positive logic remote ON/OFF control circuit is included.

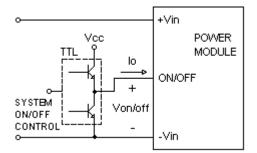

Turns the module ON during a logic High on the On/Off pin and turns OFF during a logic Low. The On/Off pin is an open collector/drain logic input signal (Von/off) that's referenced to GND. If not using the Remote On/Off feature, please open circuit between on/off pin and -input pin to turn the module on.

Remote ON/OFF Implementation

NOTE: All measurements are taken at the module terminals

EMC Considerations

Suggested Schematic for EN55022 Conducted Emission Class A Limits

To meet Conducted Emissions EN55022 CLASS A needed the following components:

LANC12xxDW12

Component	Value	Voltage	Reference
C1	6.8uF	50V	1210 MLCC
C2, C3	1000pF	2KV	1206 MLCC

LANC24xxDW12

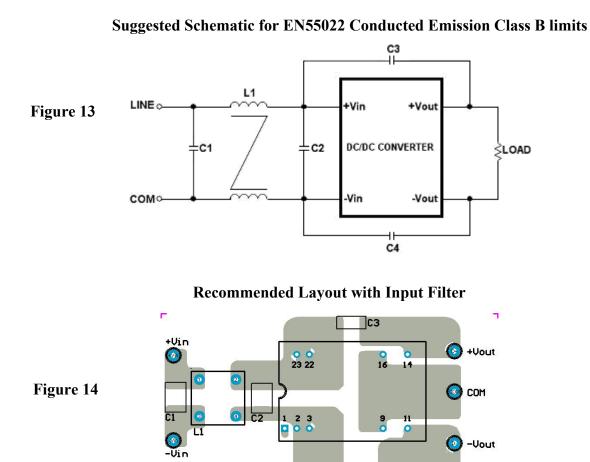

Component	Value	Voltage	Reference
C1	4.7uF	50V	1210 MLCC
C2, C3	1000pF	2KV	1206 MLCC

LANC48xxDW12

Component	Value	Voltage	Reference
C1	2.2uF	100V	1812 MLCC
C2, C3	1000pF	2KV	1206 MLCC

EMC Considerations (Continued)

L

To meet Conducted Emissions EN55022 CLASS B needed the following components:

C4

1

LANC12xxDW12			
Component	Value	Voltage	Reference
C1	3.3µF	50V	1812 MLCC

Soldering and Reflow Considerations:

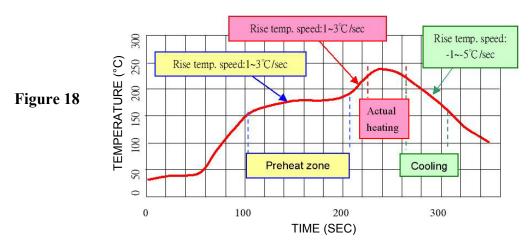

Lead Free Wave Solder Profile for DIP Type

Lead free reflow profile for SMT type

Peak temp: 250~260°C

Peak time (T1+T2 time): 4~6 sec

Actual

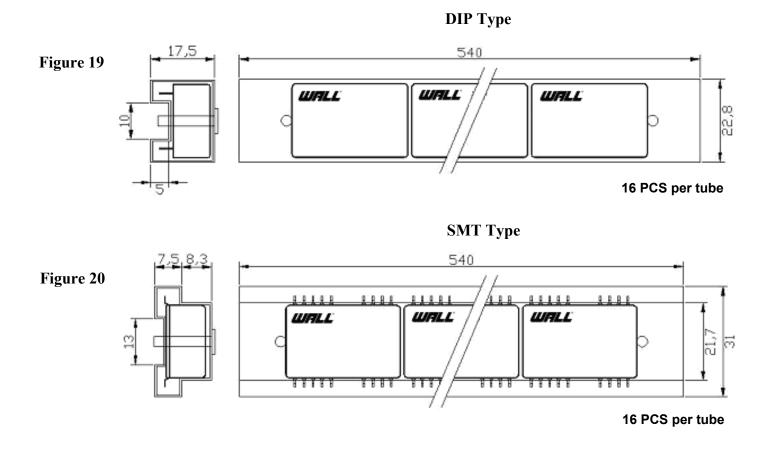

Heating

Zone	Reference Parameter
Preheat Zone	Rise temp. speed: 1~3°C/sec Preheat time: 60~120sec
	Preheat temp.155~185°C Rise temp. speed: 1~3°C/sec
Actual Heating	Melting time: 30~60 sec Melting temp: 217°C Peak temp: 230~240°C Peak time: 10~20 sec
Cooling	Rise temp. speed: -1~ -5°C/sec

Reference Solder: Sn-Ag-Cu; Sn-Cu

Packaging Information:

Safety and Installation Instruction:

Fusing Consideration

Caution: This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of sophisticated power architecture. To maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow fuse with maximum rating of 3A. Based on the information provided in this data sheet on inrush energy and maximum DC input current; the same type of fuse with lower rating can be used. Refer to the fuse manufacturer's data for further information.

MTBF and Reliability

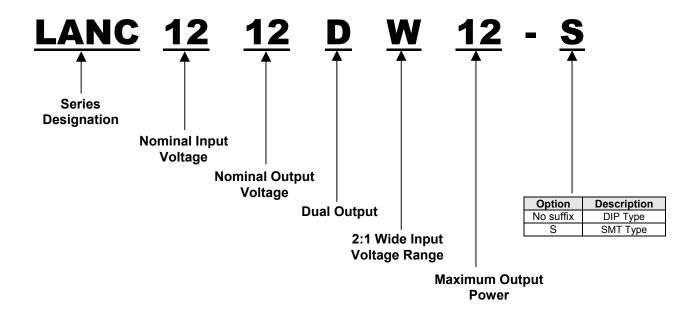

The MTBF of the LANCW12 dual output series of DC/DC converters has been calculated using Bellcore TR-NWT-000332 Case I: 50% stress, Operating Temperature at 40°C (Ground fixed and controlled environment). The resulting figure for MTBF is 2.75×10^6 hours.

MIL-HDBK 217F NOTICE2 FULL LOAD, Operating Temperature at 25°C. The resulting figure for MTBF is 1.078×10^6 hours.

Company Information:

Wall Industries, Inc. has created custom and modified units for over 40 years. Our in-house research and development engineers will provide a solution that exceeds your performance requirements on-time and on budget. Our ISO9001-2000 certification is just one example of our commitment to producing a high quality, well documented product for our customers.

Our past projects demonstrate our commitment to you, our customer. Wall Industries, Inc. has a reputation for working closely with its customers to ensure each solution meets or exceeds form, fit and function requirements. We will continue to provide ongoing support for your project above and beyond the design and production phases. Give us a call today to discuss your future projects.

Contact Wall Industries for further information:
