

s Inc

FEATURES

- Efficiency up to 80%
- Low Leakage Current
- Single & Dual Outputs
- 5600VDC I/O Isolation
- Short Circuit Protection
- MTBF > 700,000 Hours
- MIBE > 700,000 Hours
- Low Isolation Capacitance
- 2:1 Wide Input Voltage Range
- Operating Temperature: -40°C to +55°C
- Medical Safety Approval UL/cUL 60601-1⁽⁵⁾
- All I/O Clearance and Creepage Distance 2.0mm min.
- Complies with EN55022 Class A with External Coupling Capacitor Cio=1nF < Class B

DESCRIPTION

The ME series of medical approved (UL/cUL 60601-1) dc/dc converters are specially designed to provide ultra high levels of isolation (5600VDC) in a 24-pin DIP package. These converters operate over input voltage ranges of 9-18VDC, 18-36VDC, and 36-75VDC. This series also provides regulated single and dual output voltages of 5, 12, ±12, and ±15VDC. The -40°C to +55°C operating temperature makes this series of dc/dc converters ideal for data communication equipment, mobile battery driven equipment, distributed power systems, process/machine control equipment, telecommunications equipment, mixed analog/digital subsystems, computer peripheral systems, and industrial robot systems. These converters have a power rating of 6W and a typical full load efficiency of 80%. This series complies with EN55022 Class A conducted noise and radiated emissions with an external coupling capacitor Cio=1nF < Class B. The EN55022 Class A conducted noise compliance minimizes design time, cost, and eliminates the need for external filter components. All models are over load and short circuit protected.

SPECIFICATIONS: ME Series						
All specifications are based on 25° We reserve the ri	C, Nominal Input Voltage, and Maximum Output Current ght to change specifications based on technological advi	unless otherv ances.	vise noted.

For each output

NOTES

- 1. Transient recovery time is measured to within 1% error band for a step change in output load of 75% to 100%.
- 2. The ME series requires a minimum output loading to maintain specified regulations. Operation under no-load conditions will not damage these devices, however they may not meet all listed specifications.
- 3. All DC/DC converters should be externally fused at the front end for protection.
- 4. Other input and output voltages may be available, please contact factory.
- 5. This product is Listed to applicable standards and requirements by UL.

*Due to advances in technology, specifications subject to change without notice.

DESIGN & FEATURE CONSIDERATONS

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup. A capacitor mounted close to the power module helps ensure stability of the unit. It is recommended to use a good quality low Equivalent Series Resistance (ESR < 1.0Ω at 100KHz) capacitor of 10µF for the 12V input models, 4.7μ F for the 24V input models, and a 2.2μ F for the 48V input models.

Maximum Capacitive Load

The ME Series has a limit of connected capacitance at the output. The power module may operate in current limiting mode during start-up, which affects the ramp-up and the startup time. Connect capacitors at the point of load for best performance. The maximum capacitive load can be found in the "Output Voltage / Current Rating Chart" on page 2.

TEST CONFIGURATIONS

Input Reflected-Ripple Current Test Setup

Input reflected-ripple current is measured with an inductor Lin (4.7 μ H) and Cin (220 μ F, ESR < 1.0 Ω at 100KHz) to simulate source impedance.

Capacitor Cin offsets possible battery impedance.

Current ripple is measured at the input terminals of the module. Measurement bandwidth is 0 ~ 500KHz.

Peak-to-Peak Output Noise Measurement Test

Use a Cout 0.47µF ceramic capacitor.

Scope measurement should be made by using a BNC socket; measurement bandwidth is 0 ~ 20MHz. Position the load between 50mm and 75mm from the DC/DC Converter.

Rev C

Output Ripple Reduction

A good quality low ESR capacitor placed as close as possible across the load will give the best ripple and noise performance. To reduce output ripple it is recommended to use a 3.3μ F capacitor at the output.

Rev C

Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module, and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 95°C. The derating curves are determined from measurements obtained in an experimental apparatus.

Electromagnetic Emission EN 55022 < A

Conducted and radiated emissions < A with external coupling capacitor Cio=1nF < B

COMPANY INFORMATION:

Wall Industries, Inc. has created custom and modified units for over 50 years. Our in-house research and development engineers will provide a solution that exceeds your performance requirements on-time and on budget. Our ISO9001: 2015 certification is just one example of our commitment to producing a high quality, well-documented product for our customers.

Our past projects demonstrate our commitment to you, our customer. Wall Industries, Inc. has a reputation for working closely with its customers to ensure each solution meets or exceeds form, fit and function requirements. We will continue to provide ongoing support for your project above and beyond the design and production phases. Give us a call today to discuss your future projects.
