Size: 4.60in x 2.40in x 0.5in
(116.8mm x 61mm x 12.7mm)

## FEATURES

- Operating Input Voltage Range of 90~290VAC or 130~400VDC
- Digital Control, Built-In PFC
- Built-In Soft Start Circuit
- PMBus 1.2 Communication Protocol
- Full Brick Size with Base Plate
- Current Sharing (N≤6)
- Over Current, Short Circuit, Over Voltage and Over Temperature Protection
- Negative Logic
- Remote ON/OFF and SENSE
- Module can be Paralleled
- RoHS6 Compliant
- CB, CE, UL Approvals

## APPLICATIONS

- Servers/Storage Equipment
- Routers/Switches
- Telecommunications Equipment
- Enterprise Networks

## DESCRIPTION

The PSB500 series of AC/DC power modules offers up to 500 watts of output power in a 4.60” x 2.40” x 0.5” full brick package. This series consists of single outputs models with an operating input voltage range of 90~290VAC or 130~400VDC. Each model in this series has digital control, built-in PFC, and remote ON/OFF and SENSE. Each model has over current, short circuit, over voltage, and over temperature protection, is RoHS compliant, and has CB, CE, and UL approvals. Please contact factory for order details.

## MODEL SELECTION TABLE

| Model Number | Input Voltage Range | Output Voltage | Output Current | Efficiency | Output Power | Ripple & Noise |
|---|---|---|---|---|---|---|
| PSB12S-500 | 90~290VAC (130~400VDC) | 12VDC | 0~42A | 91% Max. | 500W | <1%Vo |
| PSB28S-500 | | 28VDC | 0~18A | 92% Max. | | |
| PSB48S-500 | | 48VDC | 0~10.5A | 92.8% Max. | | |

## SPECIFICATIONS

All specifications are based on 25°C, Nominal Input Voltage, and Maximum Output Current unless otherwise noted.
We reserve the right to change specifications based on technological advances.

| SPECIFICATION | TEST CONDITIONS | | | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|---|
| **INPUT SPECIFICATIONS** | | | | | | | |
| Input Voltage Range | AC | | | 90 | | 290 | VAC |
| | DC | | | 130 | | 400 | VDC |
| Rated Input Voltage | | | | 100 | 110/220 | 240 | VAC |
| Absolute Maximum Input Voltage | | | | | | 315 | VAC |
| Frequency | | | | 47 | 50/60 | 63 | Hz |
| Input Current | Vin=90VAC, 100% Load | | | | | 8 | A |
| Inrush Current | @110VAC | | | | | 20 | A |
| | @220VAC | | | | | 40 | |
| Power Factor | Vin=110/220VAC, 25ºC, 100% Load | | | 0.95 | | | |
| THD | Vin=110/220VAC, 25ºC, Pout=500W | | | | | 10 | % |
| Input Undervoltage Protection | Protection Threshold | | | 74 | | 85 | VAC |
| | Recovery Threshold | | | | | 90 | |
| | Hysteresis | | | 5 | | | |
| Input Overvoltage Protection | Protection Threshold | | | 295 | | 310 | VAC |
| | Recovery Threshold | | | 290 | | | |
| | Hysteresis | | | 5 | | | |
| Input Voltage Precision | 25ºC, Vin=90~290VAC | | | -10 | | 10 | VAC |
| **PROTECTION** | | | | | | | |
| Short Circuit Protection | Module is not damaged even with long-term short circuits | | | Self-Recovery | | | |
| Over Current Protection | Self-Recovery | | | 105 | | 150 | % |
| Over Voltage Protection | Latch | | 12VDC Model | | 15.5 | | V |
| | | | 28VDC Model | | 37 | | |
| | | | 48VDC Model | | 59.5 | | |
| Over Temperature Protection[6] | Self-Recovery | 12VDC & 48VDC Models | Baseplate | 90 | | | ºC |
| | | | Hysteresis | 5 | | | |
| | | 28VDC Models | Baseplate | 95 | | | |
| | | | Hysteresis | 5 | | | |
| **REMOTE ON/OFF CONTROL** | | | | | | | |
| Negative Logic | Low Level | | | 0 | | 0.8 | V |
| | High Level | | | 2.4 | | 3.5 | |

## SPECIFICATIONS

All specifications are based on 25°C, Nominal Input Voltage, and Maximum Output Current unless otherwise noted.
We reserve the right to change specifications based on technological advances.

| SPECIFICATION | TEST CONDITIONS | | | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|---|
| **OUTPUT SPECIFICATIONS** | | | | | | | |
| Output Voltage | | | | See Table | | | |
| Voltage Initial Setting | PSB12S-500 | | | 11.88 | | 12.12 | V |
| | PSB28S-500 | | | 27.72 | | 28.28 | |
| | PSB48S-500 | | | 47.52 | | 48.48 | |
| Line Regulation | Vin=90-290VAC, Max. Output Power | | | | ±0.3 | | %Vo |
| Load Regulation | Vin=220VAC, 0-Max. Output Power | | | | ±0.8 | | %Vo |
| External Load Capacitance | 12VDC Model | Output capacitor: low ESR aluminum capacitor (recommended product model: APXE160ARA221MHA0G NCC) | | 220 x 6 | | 10000 | µF |
| | | Boost voltage bulk capacitor: long life aluminum capacitor (recommended product model: ELXS451VSN391MR50S NCC) | | 390 | | 390 x 2 | |
| | 24VDC & 48VDC Models | Output Capacitor: low ESR aluminum capacitor (recommended product model: EKY-630ELL471MK25S NCC) | | 470 x 3 | | 470 x 11 | |
| | | Boost volta+ge bulk capacitor: long life aluminum capacitor (recommended product model: ELXS451VSN391MR50S NCC) | | 390 | | 390 x 2 | |
| Voltage Adjustment Range (Trim)[1] | PSB12S-500 | | | 9.6 | | 13.2 | V |
| | PSB28S-500 | | | 20 | | 32 | |
| | PSB48S-500 | | | 36 | | 55 | |
| Regulated Voltage Precision | Full Range of $V_{IN}$ $V_{OUT}$ and $T_A$ | | | -3 | | +3 | % |
| Output Power | | | | See Table | | | |
| No Load Power | 110VAC, 25ºC | | | | | 10 | W |
| | 220VAC, 25ºC | | | | | 12 | |
| Output Current[2] | | | | See Table | | | |
| Ripple & Noise (Pk-Pk, 20MHZ BW) | 12VDC Model | Ambient Temp: ≥-5ºC | | | 100 | 240 | mV |
| | | Ambient Temp: -40 ~ -5ºC | | | | 240 | |
| | 28VDC Model | Ambient Temp: -5 ~ 85ºC | | | | 320 | |
| | | Ambient Temp: -25 ~ -5ºC | | | | 640 | |
| | | Ambient Temp: -40 ~ -25ºC | | | | 640 | |
| | 48VDC Model | Ambient Temp: -5 ~ 85ºC | | | | 550 | |
| | | Ambient Temp: -25 ~ 5ºC | | | | 800 | |
| | | Ambient Temp: -40 ~ -25ºC | | | | 800 | |
| Standby Power | 110/220VAC, 25ºC | | | | | 5 | W |
| Hold-Up Time[3] | Bulk Capacitor: 390µF, Ambient Temp: 25ºC, 100% Load from input power outage to 90% Vout | | | 10 | | | mS |
| Output Voltage Delay Time | From $V_{IN}$ connection to 10% $V_{OUT}$ | | | | | 8 | S |
| Output Voltage Rise Time | From 10% $V_{OUT}$ to 90% $V_{OUT}$, Ambient Temp: 25ºC | | | | | 100 | mS |
| | From 10% $V_{OUT}$ to 90% $V_{OUT}$, Ambient Temp: -40 ~ -25ºC[4] | | | | | 400 | |

## NOTES

1. The output voltage can be adjusted by 12C or the Trim pin. Preferentially use the Trim pin for output voltage adjustment.
2. Oscilloscope Bandwidth: 20MHz; Ripple and Noise depends on the environment temperature and external filter circuit. Reference technical manual.
3. Output Capacitor of 12VDC Models: 220µF x 6
   Output Capacitor of 28VDC & 48VDC Models: 470µF x 3
4. When the temperature is below -25ºC, there is no requirement on the output voltage rise waveform.
5. The output power of each module must be greater than 200W. The voltage difference between modules connected in parallel should be less than 5%
6. Needs to be connected to -S if output voltage adjustment is required.
7. The over temperature protection threshold is obtained by measuring the temperature of the middle of the baseplate.
8. Certified to 4000m
9. This product is Listed to applicable standards and requirements by UL.

**Due to advances in technology, specifications subject to change without notice.*

NOTES:
1. All dimensions: in mm [in].
Tolerances: x.x±0.5mm [x.xx±0.02in], x.xx±0.25mm [x.xxx±0.010in] unless otherwise specified.
2. Pin 1-6: 1.00±0.05mm [0.039±0.001in.]
3. Pin 7-8: 2.00±0.05mm [0.079±0.001in]

### PIN DEFINITION

| Pin Number | Name | | Function |
|---|---|---|---|
| 1 | AC1 | | AC Input |
| 2 | AC2 | | |
| 3 | SP | | Surge Protection |
| 4 | R | | External Resistor for Inrush Current Protection |
| 5 | +BC | | Boost Output Voltage (+) |
| 6 | -BC | | Boost Output Voltage (-) |
| 7 | +VOUT | | +DC Output |
| 8 | -VOUT | | -DC Output |
| 9 | +S | | Remote Sense (+) |
| 10 | -S | | Remote Sense (-) |
| 11 | COM | | Common Ground |
| 12 | AUX | | Auxiliary Power Supply (12V0.2A, to the *COM*) |
| 13 | CB | | Current Balance for Parallel Operation |
| 14 | ENA | | Enable signal or AC loss signal (OC), Function reuse:<br>1. Output voltage OK indicating pin, when output voltage exceeds a threshold, the pin is in the state of low resistance<br>2. AC input OK indicating pin, when the AC Vin is powered off, the pin is in a high impedance state |
| 15 | SDA | | PMBus Serial Data Line |
| 16 | SCL | | PMBus Serial Clock Line |
| 17 | ALERT | | PMBus Alert |
| 18 | CNT | | ON/OFF Control (Output Side) (Negative Logic) |
| 19 | 12VDC | NC | - |
| | 28VDC & 48VDC | TRIM | Adjustment of Output Voltage |
| 20 | ADDR | | Module Address (An External Resistor to the *COM*) |

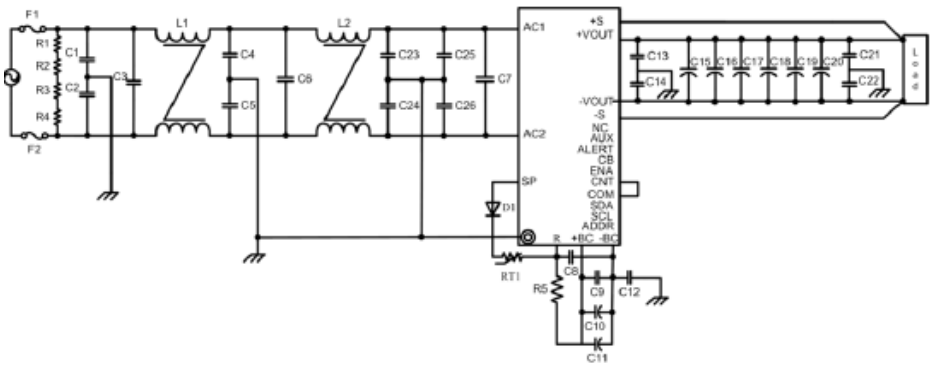
## TYPICAL APPLICATION CIRCUIT

12VDC Model



Typcial Application Circuit

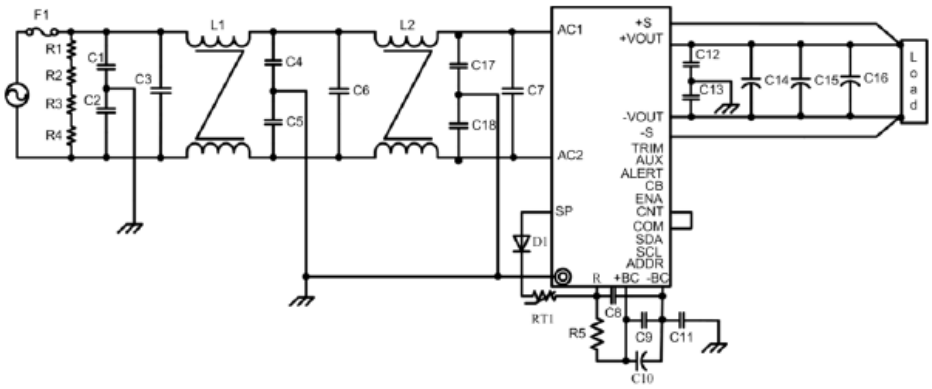
Notes:
1. C10, C11, C15, C16, C17, C18, C19, C20: When the temperature is lower than -25ºC, recommended capacitance should be doubled.
2. When selecting an output capacitor, consider not only the ripple voltage but aslo the ripple current to prevent risks caused by using a capacitor outside its specificationa. A Γ-shaped filter circuit can be used to reduce the ripple current of an output capacitor.

R1, R2, R3, R4: 0.25W, 100kΩ
R5: Cement resistor, 5W, 75Ω
F1, F2: 15A, 250VAC

L1, L2: 6mH
C1, C2: Ceramic capacitor, 1nF, 250V
C3, C7: Film capacitor, 1μF, 275VAC
C4, C5: 2.2nF, 250V
C6: Film capacitor, 0.68μF, 275VAC
C8, C9: Film capacitor, 1.5μF, 450V
C10, C11: Long life (5000h) aluminum electrolytic capacitor, 390μF, 450V (recommended product model: ELXS451VSN391MR50S NCC)
C12: 2200pF
C13, C14: 220nF, 1kV
C15, C16, C17, C18, C19, C20: Low ESR aluminum electrolytic capacitor, 220μF, 16V (recommended product model: APXE160ARA221MHA0G NCC)
C21, C22: 22nF, 1kV
C23, C24: Ceramic capacitor, 4.7nF, 250V
C25, C26: Ceramic capacitor, 1nF, 250V

D1: 1kV, 3A
RT: NTC resistor 1Ω

## 28VDC Model



Typcial Application Circuit

Notes:
1. C10, C14, C15, C16: When the temperature is lower than -25ºC, recommended capacitance should be doubled.
2. When selecting an output capacitor, consider not only the ripple voltage but aslo the ripple current to prevent risks caused by using a capacitor outside its specificationa. A Γ-shaped filter circuit can be used to reduce the ripple current of an output capacitor.

R1, R2, R3, R4: 0.25W, 100kΩ
F1: 15A, 250VAC
L1, L2: 3.5mH

RT1: NTC resistor 1Ω

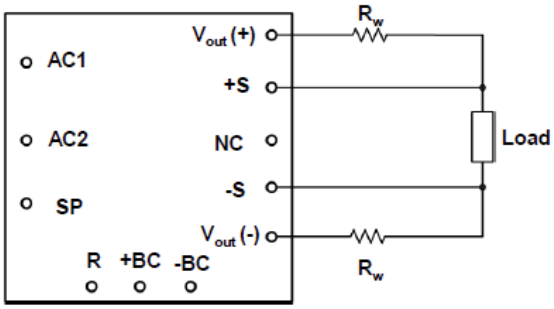
## REMOTE SENSE

This function is used to compensate for voltage drops on $R_W$, which indicates the line impedance between the output and the load. +S, -S, $V_{OUT}$ (+), and $V_{OUT}$ (-) should meet the following requirements:

$[V_{OUT} (+) – (+S)] \leq 5\% V_{OUT}$
$[(-S) – V_{OUT} (-)] \leq 0.5V$

$V_{OUT}$ is the rated output voltage:
12VDC Model: $11.4V \leq [V_{OUT} (+) - V_{OUT} (-)] \leq 12.6V$
28VDC Model: $20V \leq [V_{OUT} (+) - V_{OUT} (-)] \leq 32V$
48VDC Model: $36V \leq [V_{OUT} (+) – V_{OUT} (-)] \leq 55V$



Configuration Diagram for Remote Sense

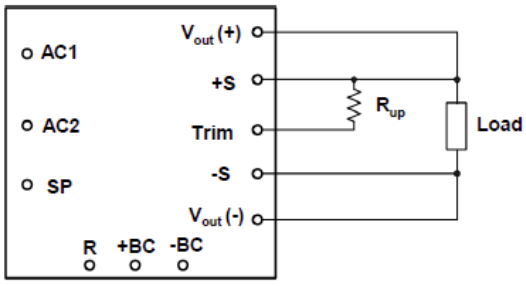
If the remote sense function is not required, +S should be connected to $V_{OUT}$ (+) and -S should be connected to $V_{OUT}$ (-).

## OUTPUT VOLTAGE TRIM

28VDC & 48VDC Models

Output voltage can be adjusted within the trim range by using the Trim pin.

Trim Up
The output voltage can be increased by connecting an external resistor between the Trim pin and the +S pin.



Configuration Diagram for Trim Up

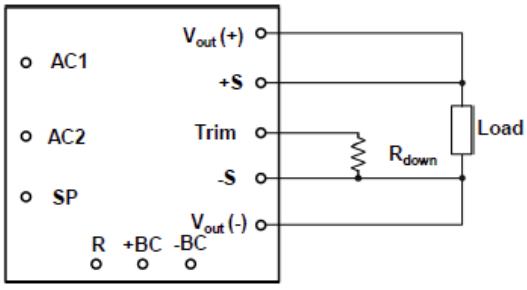
28VDC Model: Relationship between $R_{up}$ and $V_{OUT}$:

$$R_{up} = \frac{26550 \times V_{OUT}}{V_{OUT} - 28} - 3300(\Omega)$$

48VDC Model: Relationship between $R_{up}$ and $V_{OUT}$:

$$R_{up} = \frac{46300 \times V_{OUT}}{V_{OUT} - 48} - 3300(\Omega)$$

Trim Down
The output voltage can be decreased by connecting an external resistor between the Trim pin and the -S pin.



Configuration Diagram for Trim Down

28VDC Model: Relationship between $R_{down}$ and $V_{OUT}$:

$$R_{down} = \frac{2000 \times V_{OUT}}{28 – V_{OUT}} - 3300(\Omega)$$

48VDC Model: Relationship between $R_{down}$ and $V_{OUT}$:

$$R_{down} = \frac{2000 \times V_{OUT}}{48 - V_{OUT}} - 3300(\Omega)$$

Note:
1. If the Trim pin is not used, it should be left open.
2. When output voltage adjustment is used, ensure that the output voltage is within the required range; otherwise the protection function will be activated.
3. Ensure that the actual output power does not exceed the maximum output power when raising the voltage.

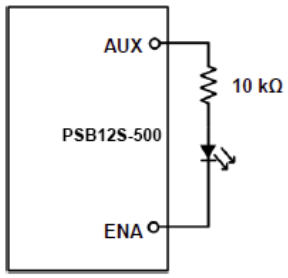
## ENABLE (ENA)

### 12VDC Model

The Enable signal indicates that the output voltage of the module is normal and can supply power to the load (maximum sink current is 10mA and maximum applied voltage is 75V). When the output voltage exceeds 8V at startup, ENA is in low resistance state. When the output voltage drops below 6V or input power fails, ENA is in high resistance state. The logic of Enable is as follows:

| Logic Enable | ENA | Output Voltage |
|---|---|---|
| Negative Logic | High Resistance | ≤6V or input fault, input power failure |
| | Low Resistance | >8V |

The Enable signal is pulled up to the AUX by a 10kΩ external resistor, indicted by an LED.



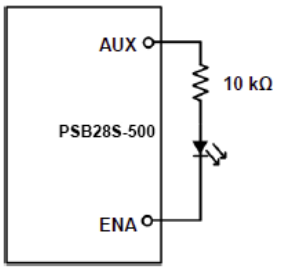
Recommended circuit diagram of Enable

### 28VDC Model

The Enable signal indicates that the output voltage of the module is normal and can supply power to the load (maximum sink current is 10mA and maximum applied voltage is 75V). When the output voltage exceeds 15V at startup, ENA is in low resistance state. When the output voltage drops bellows 13V or input power fails, ENA is in high resistance state. The logic of Enable is as follows:

| Logic Enable | ENA | Output Voltage |
|---|---|---|
| Negative Logic | High Resistance | ≤13V or input fault, input power failure |
| | Low Resistance | >15V |

The Enable signal is pulled up to the AUX by a 10kΩ external resistor, indicated by an LED.



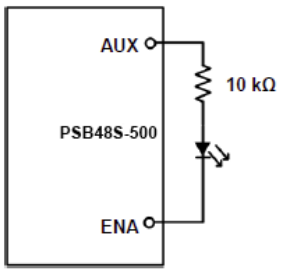
Recommended circuit diagram of Enable

### 48VDC Model

The Enable signal indicates that the output voltage of the module is normal and can supply power to the load (maximum sink current is 10mA and maximum applied voltage is 75V). When the output voltage exceeds 30V at startup. ENA is in low resistance state. When the output voltage drops below 28V or input power fails, ENA is in high resistance state. The logic of Enable is as follows:

| Logic Enable | ENA | Output Voltage |
|---|---|---|
| Negative Logic | High Resistance | ≤28V or input fault, input power failure |
| | Low Resistance | >30V |

The Enable signal is pulled up to the AUX by a 10kΩ external resistor, indicated by an LED.

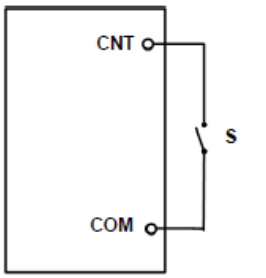


Recommended circuit diagram of Enable

## CNT (ON/OFF)

The CNT (On/Off) pin provides the remote control function without turning the input power supply on or off. When the remote control function is not required, short-circuit CNT and COM. The logic of On/Off is as follows:

| Logic Enable | On/Off | Output |
|---|---|---|
| Negative Logic | Low Level | On |
| | High Level or Left Open | Off |



Configuration diagram of CNT (On/Off) signal

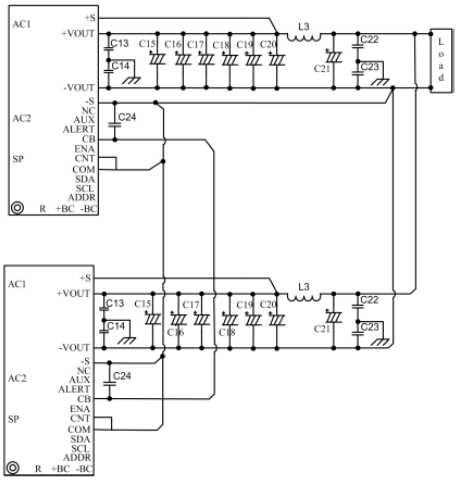
## AUXILIARY POWER SUPPLY (AUX)

The AUX pin supplies auxiliary power to an external circuit with a typical output voltage of 12V. Be careful not to short-circuit the pin and other pins on the module; otherwise the module will be damaged. Do not connect the AUX pin if power supply to an external circuit is not required.

## PARALLEL OPERATION (CB)

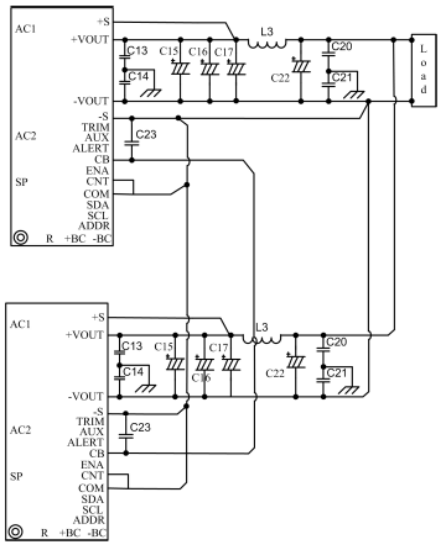
When several modules are used in parallel, an output current can be equally drawn from each module by connecting the CB pins of all modules. A maximum of two modules can be connected in parallel is equal to or less than 90% of the power of two fully loaded modules.

### 12VDC Model



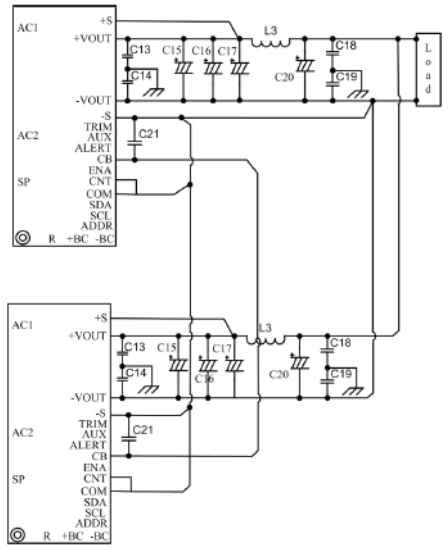
Notes:4
1. L3: High frequency inductor 0.3μH
2. C21: Aluminum electrolytic capacitor 16V, 220μF
3. C24: 1μF, 16V
4. For other capacitor parameters, see EMC

### 28VDC Mode



Notes:
1. L3: High frequency inductor 0.3μH
2. C22: Aluminum electrolytic capacitor 63V, 470μF
3. C23: 1μF, 16V
4. For other capacitor parameters, see EMC

### 48VDC Model



Notes:
1. L3: High frequency inductor 0.3μH
2. C20: Aluminum electrolytic capacitor 63V, 470μF
3. C21: 1μF, 16V
4. For other capacitor parameters, see EMC

## PMBUS COMMUNICATION

The module communicates with the system over the PMBus. The following table describes the PMBus address:

| R (ADDR Pull Down Resistor) | Address |
|---|---|
| Left Open | Invalid |
| 200kΩ | 0x5F |
| 174kΩ | 0x5E |
| 150kΩ | 0x5D |
| 124kΩ | 0x5C |
| 100kΩ | 0x5B |
| 75kΩ | 0x5A |
| 49.9kΩ | 0x59 |
| 24.9kΩ | 0x58 |
| Ground | Invalid |

The address bit is as follows:

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| - | Address | | | | | | | Read/Write |

### Monitoring and Fault Detection

The module communicates with the system over the PMBus. It provides the monitoring and the fault detection functions.

The module monitors the following:

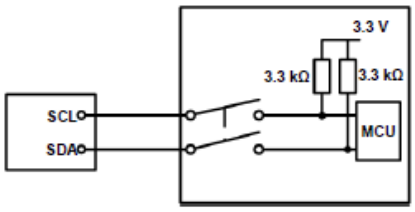
- Module Information
- Input Voltage
- Input Power
- Output Voltage
- Output Power
- Baseplate Temperature
- CNT (On/Off)

The module detects and reports the following:

- Input faults
- Output overvoltage
- Output overcurrent
- Baseplate overtemperature

### SCL and SDA

Within the PSU, the SCL and SDA are each connected to a pull-up resistor. Externally, the SCL and SDA are connected to the system through the fault isolation circuit.



Interconnect diagram of SCL and SDA

### PMBus Timing

The module supports both 100kHz (default) and 400kHz clock rates. $T_{SET}$ is the duration for which SDA keeps its value unchanged before SCL increases. $T_{hold}$ is the duration for which SDA keeps its value unchanged after SCL decreases.

Communication will fail if parameter values are consistent with those provided in the following table.

| Parameter | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|
| Logic Input Low ($V_{IL}$) | - | - | 1.1 | V |
| Logic Input High ($V_{IH}$) | 2.1 | - | - | V |
| Logic Output Low ($V_{OL}$) | - | - | 0.25 | V |
| Logic Output High ($V_{OH}$) | 2.7 | - | - | V |
| PMBus Setup Time | 100 | - | - | ns |
| PMBus Hold-Up Time | 0 | - | - | ns |
| Clock/Data Fall Time($t_f$) | 20+ 0.1Cb | - | 300 | ns |
| Clock Data Rise Time ($t_r$) | | - | 300 | ns |
| Total Capacitance of One Bus Line (Cb) | - | - | 400 | pF |

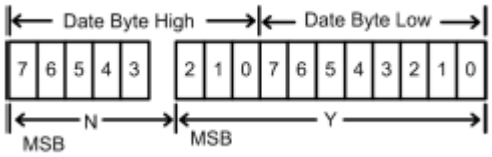
## Data Format

- Linear 11 data format
  The linear data format is a two day byte value with an 11-bit binary signed mantissa (two's complement) and a 5-bit binary signed exponent (two's complement) as shown in figure below:

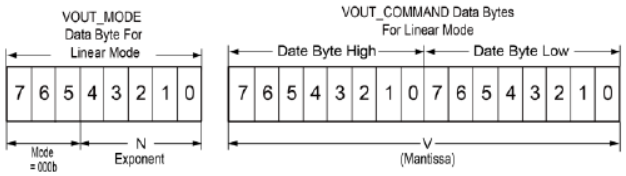


Linear 11 Data Format

The relationship between N, Y, and actual value V is given by the following equation: $X = Y \times 2^N$
12VDC Model: Y is the 11-bit, binary signed mantissa (two's complement)
28VDC & 48VDC Models: Y is the 11-bit two's complement mantissa

12VDC Model: N is the 5-bit, binary signed exponent (two's complement)
28VDC & 48VDC Models: N is the 5-bit, two's complement exponent

- VOUT data format
  Commands related to the output voltage are VOUT_MODE and READ_VOUT for the 12VDC model and VOUT_COMMAND, VOUT_MODE, and READ_VOUT for 28VDC and 48VDC models. The data for these commands is a 16 bit unsigned integer, as shown in figure below.



Vout Data Format

Output Voltage is calculated as follows: $V \times 2^N$
Where:
Voltage is the output voltage value.
V is the 16-bit unsigned integer
N is the 5-bit signed integer (two's complement)

## Command Descriptions

OPERATION (01h): By default, the module is turned ON as long as Enable active-low.
The OPERATION command is used to turn the module ON or OFF via the PMBus. It uses the following data bytes.

| Function | Data Byte |
|---|---|
| ON | 0x80 |
| RESET | 0x00 |
| OFF | 0x55 |

To reset the module after it is turned OFF, wait at least 10 seconds, and then turn it ON. All alarms and shutdowns are cleared during a restart.

CLEAR_FAULTS (03h): Clears the latch fault.

STORE_DEFAULT_ALL (11h): Saves calibrated or modified data. If this command is not sent, calibrated or modified data cannot be saved in the event of a power failure.

VOUT_MOTE (20h): Determines the data type and parameters used by a PMBus command.

12VDC Model: POUT_MAX (31h): Configures the power limiting point (value range: 300W to 550W). The function allows users to change the constant current protection threshold. The constant current can be calculated based on the configured power limiting point and output voltage.
28VDC & 48VDC Models: VOUT_COMMAND (21h): This command is used to change the output voltage of the power supply. The default value for 28VDC models is 28VDC (voltage range 20-32VDC). The default value for 48VDC models is 48VDC (voltage range: 36-55VDC).

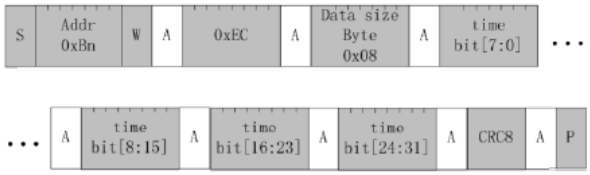
STATUS_WORD (79h): Reports module fault information. The module latches off after a fault occurs.

| Bit | Fault Name | Definition |
|---|---|---|
| b15-b6 | - | - |
| b5 | VOUT_OV | 1-Over Voltage, 0-Normal |
| b4 | IOUT_OC | 1- Over Current, 0-Normal |
| b3 | - | - |
| b2 | OVER_TEMPERATURE | 1-Over Temperature, 0-Normal |
| b0, b1 | - | - |

MFR_STATUS_WORD (E9h): Reports the module stat.

| Bit | Fault Name | Fault Definition |
|---|---|---|
| b15-b1 | - | - |
| b0 | REMOTE ON/OFF | 1-OFF, 0-ON |

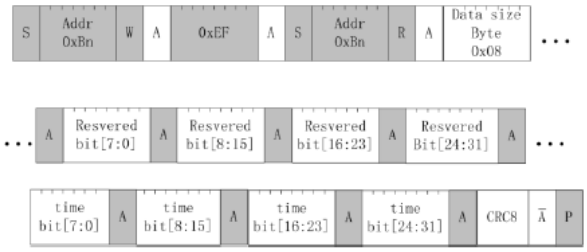
MFR_WRITE_SYSTIME (ECh): As the module does not have a time chip, the system uses the ECh command to deliver the system time to the module. The module then runs based on the delivered system time in unit of seconds. To ensure time accuracy, it is recommended that the system synchronize time to the module every 10 minutes. The MFR_WRITE_SYSTIME command format is shown below.



MFR_WRITE_SYSTIME command format

Note: S: Start Condition, R: Rated bit value of 1, W: Write bit value of 0, A: Acknowledge bit, may be ACK or NACK, P: Stop Condition

MFR_READ_LAST_ACDROP_TIME (EFh): Reads the last disconnection time recorded by the module. The EFh data format is shown in the figure. The time occupies four bytes and the high-order byte takes precedence over the low-order byte during transmission.



MFR_READ_LAST_ACDROP_TIME command format

The module used 8-bit cyclic redundancy check (CRC). The fenerator plynominal is C(x)= x8 + x2 + x1 +1, or 0b100000111 if expressed in binary form. The module complies with the PMBus Protocol Specifiaction rev1.2 requirements.

## PROTECTION CHARACTERISTICS

### Input Over Voltage Protection

The module will shut down after the input voltage exceeds the input over voltage protection threshold. The module will start to work again after the input voltage reaches the input over voltage recovery threshold. For hysteresis, see protection characteristics.

### Input Under Voltage Protection

The module will shut down after the input voltage drops below the under voltage protection threshold. The module will start to work again after the input voltage reaches the input under voltage recovery threshold. For the hysteresis, see protection characteristics.

### Output Over Voltage Protection

When the output voltage exceeds the output over voltage protection threshold, the module will enter hiccup mode. If the module experiences five or more times of over voltage due to an internal fault within 20s, the module latches off. You need to restart the module to unlock it. You must power on the module at least 20s after powering it off. The module dynamic over voltage does not exceed 17V for 12VDC model, 39V for 28VDC models, and 69V for 48VDC model.

### Output Over Current Protection

When the output current exceeds the output overcurrent protection threshold, the module will enter hiccup mode. When the fault condition is removed, the module will automatically restart.

### Over Temperature Protection

A temperature sensor on the module sense the average temperature of the module. It protects the module from being damaged at high temperatures. When the temperature exceeds the over temperature protection threshold, the output will shut down. If the temperature drops below the over temperature protection recovery threshold more than 5 minutes after the module shuts down, the output recovers. Note that the sensor does not sense the temperature within 5 minutes after the output shuts down. Therefore, even if the temperature drops to a very low level within 5 minutes after the output shuts down, there is still no output.

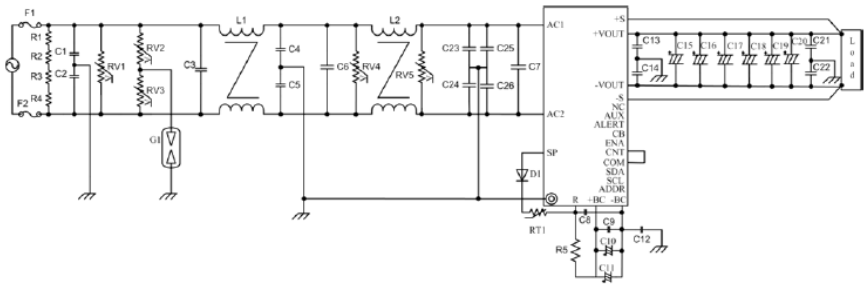
### Cooling Characteristics

When the module is running, the temperature of the baseplate must not exceed 90ºC. The module supports natural cooling and fan cooling. Users can select heat sink models depending on the onsite conditions.

## EMC

### 12VDC Model

The figure below shows the EMC test set-up diagram. The acceptance standard must meet the requirements of the conducted emission limits of CISRP22 Class B with 6 dB margin. The level of surge is CM/DM 6kV/6kV 2Ω (1.2/50), and the level of impulse current is CM/DM 5kA/5kA (8/20).



EMC Test set-up diagram

Note: C10, C11, C15, C16, C17, C18m C19, C20: When the temperature is lower than -25ºC, the recommended capacitance should be doubled.

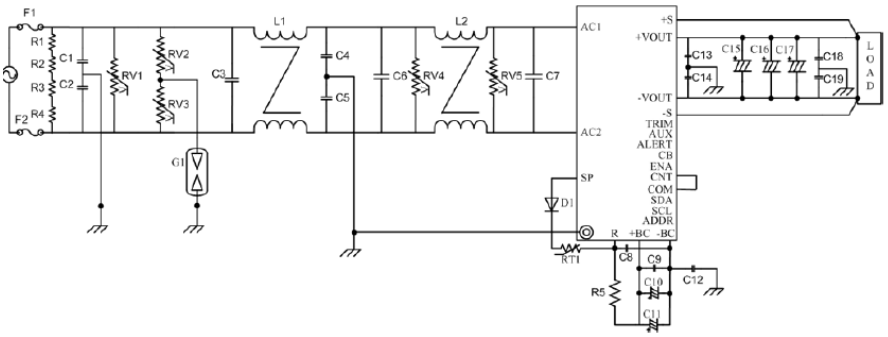
C18, C19: 1nF, 250V
C20, C21: 22nF, 1kV

D1: 1kV, 3A
R5: Cement resistor, 5W, 75Ω
R6, R7: 0.25W, 22Ω
RT1: NTC resistor 1Ω
G1: 10kA, 1.5kV
F1, F2: 15A, 250VAC

48VDC Model

The figure below shows the EMC test set-up diagram. The acceptance standard must meet the requirements of the conducted emission limits of CISPR22 Class B with 6 dB margin. The level of surge is CM/DM 6kV/6kV 2Ω (1.2/50), and the level of impulse current is CM/DM 5kA/5kA (8/20).



EMC test set-up diagram

Note: C10, C11, C15, C16, C17: When the temperature is lower than -25ºC, the recommended capacitance should be doubled.

R1, R2, R3, R4: 0.25W, 100kΩ
R5: Cement resistor, 5W, 75Ω
F1, F2: 15A, 250VAC
RV1: 620V, 385, 12kA
RV2, RV3: 750V, 460V, 12kA
RV4: 620V, 385V, 12kA
RV5: 620V, 385V, 4.5kA

L1: 3.5mH, L2: 5-12mH
C1, C2: Ceramic capacitor, 1nF, 250V
C3, C6. C7: Film capacitor, 1μF, 275VAC
C4, C5: 10nF, 250VAC
C8, C9: Film capacitor, 1.5μF, 450V
C10, C11: Long life (5000h) aluminum electrolytic capacitor, 390μF, 450V (recommended product module: ELXS451VSN391MR50S NCC)
C12: 2200pF
C13, C14: 100nF, 1kV
C15, C16, C17: Low ESR aluminum electrolytic capacitor, 470μF, 63V (recommended product model: EKY-630ELL471MK25S NCC)
C18, C19: 22nF, 1kV

D1: 1kV, 3A
RT1: NTC resistor 1Ω
G1: 10kA, 1.5kV

## QUALIFICATION TESTING

| Parameter | Units | Condition |
|---|---|---|
| Highly accelerated life test (HALT) | 6 | Low temperature limit: -60ºC; high temperature limit: 110ºC; vibration limit: 40G; temperature change rate: 40ºC per minute; vibration frequency range: 10-10000Hz |
| Temperature Humidity Bias (THB) | 12 | Maximum input voltage; 85ºC; 85% RH; 1000 operating hours under lowest load power |
| High Temperature Operation Bias (HTOB) | 12 | Rated input voltage; airflow rate: 0.5m/s (100LFM) to 5 m/s (1000 LFM); ambient temperature between +45ºC and +55ºC; 1000 operating hours; 50% to 80% load |
| Power and Temperature Cycling Test (PTC) | 12 | Rated input voltage; airflow rate: 0.5.m/s (1000 LFM); ambient temperature between -40ºC and +85ºC; 1000 operating hours; 50% load; temperature change rate: 15ºC per minute; dwell time: 22 minutes |

## THERMAL CONSIDERATION

Thermal Test Point:
Sufficient airflow should be provided to ensure reliable operating of the module. Therefore, thermal components are mounted on the top surface of the module to dissipate heat to the surrounding environment by conduction, convection, and radiation. Proper airflow can be verified by measuring the temperature at the middle of the baseplate.

Thermal Test Point

Power Dissipation
The module power dissipation is calculated based on efficiency. The following formula reflects the relationship between the consumed power ($P_d$), efficiency (η), and output power ($P_o$): $P_d = P_o (1-\eta)/\eta$

## MECHANICAL CONSIDERATION

Installation
Although the module can be mounted in any direction, free airflow must be available.

Soldering
The module supports standard wave soldering and hand soldering. Reflow soldering is not allowed.
1. For wave soldering, the temperature on the module is specified to a maximum of 260ºC for 7 seconds at most.
2. For hand soldering, the iron temperature should be maintained at 350ºC to 420ºC, and applied to the module pins for less than 10 seconds.
The module can be rinsed using the isopropyl alcohol (IPA) solvent or other suitable solvents.

## COMPANY INFORMATION

Wall Industries, Inc. has created custom and modified units for over 50 years. Our in-house research and development engineers will provide a solution that exceeds your performance requirements on-time and on budget. Our ISO9001: 2015 certification is just one example of our commitment to producing a high quality, well-documented product for our customers.

Our past projects demonstrate our commitment to you, our customer. Wall Industries, Inc. has a reputation for working closely with its customers to ensure each solution meets or exceeds form, fit and function requirements. We will continue to provide ongoing support for your project above and beyond the design and production phases. Give us a call today to discuss your future projects.
